

HAMILTON COUNTY PUBLIC HEALTH

2026 Quarterly Syphilis Report: Q1 (January - March)

Background

The purpose of this quarterly report is to provide syphilis data to community partners and the public to identify where efforts can be best directed to diagnose, prevent, and treat syphilis. Syphilis is caused by the bacterium *Treponema pallidum*. Syphilis does not go away on its own and if left untreated could lead to negative health outcomes. Syphilis can be treated with an appropriate dose of antibiotics.*

- Hamilton County Public Health (HCPH) conducts syphilis surveillance in a seven-county region known as Region 8 (R8) which includes Butler, Brown, Clermont, Clinton, Hamilton, Highland, and Warren Counties (see map below).
- Counts are for individuals newly diagnosed with syphilis within the specified time period. This could also include re-infections.
- An individual's county of residence is determined by their address at the time of diagnosis.
- These data can provide a snapshot of syphilis in the region but do not always tell the entire story. To fully understand the situation, community voices, stakeholders, and other sources should also be considered.
- Sexual contact is the most common route for syphilis transmission.
- Please see pages 6 and 7 for additional information including the descriptions of the different stages of syphilis (including congenital syphilis), data notes, and contact information.

11

New Syphilis Diagnoses

 **27%**

Decrease From Q4 2025 to Q1 2026

0%

Change Compared to Q1 of 2025

- For Q1 2026, Warren County had the highest number of new syphilis diagnoses (6) for the remaining R8 Counties.
- Demographic data for these counties may be made available upon request depending on factors including, but not limited to, privacy concerns due to low numbers.

Data Notes

- Data was downloaded from the Ohio Disease Reporting System (ODRS) on 5/1/2026.
- An individual's county of residence is determined by their address at the time of diagnosis.
- These data are provisional and subject to change as there is a lag time in reporting and counts may be added or removed.
- Data errors may occur when entering information into ODRS.
- Percentages may not equal 100% due to rounding.
- The 3-Year Quarterly Average is calculated from the previous three years (2023, 2024, and 2025).
- Any quarter where syphilis counts are above the 3-Year Quarterly Average may result in additional case interventions or response.
- Ohio Department of Health specifically disclaims responsibility for analyses, interpretations, or conclusions.
- Email HCPH.ID@hamilton-co.org with any questions regarding this report.

Syphilis Stages and Additional Information

Syphilis Stages

- Early Syphilis - This includes the Primary, Secondary, and Early Latent stages of syphilis. Symptoms could include an ulcer and/or rash. This stage is diagnosed when the infection has persisted for less than 12 months. A person is most infectious in the Early stages of syphilis.
- Late Latent/Unknown Duration - This is defined when the infection has persisted for greater than 12 months, or if the duration of the syphilis infection is not known.
- Congenital Syphilis - Including, but not limited to, when the mother of an infant has untreated or inadequately treated syphilis at delivery or if testing determines congenital syphilis and there is evidence of congenital syphilis upon physical examination.
- To read a more detailed description of the different stages of syphilis please visit: odh.ohio.gov/know-our-programs/infectious-disease-control-manual/section3/section-3-syphilis

To schedule an HIV test or other STI tests please call our HCPH Clinic at: 513-946-7610
